Intelligent Light

USING LIBSIM FOR SCALABLE IN SITU

Brad Whitlock
Intelligent light

Intelligent Light

- Established in 1984
 - Three decades in the software & services business
 - FieldView launched in 1990
 - Visi/libsim support since 2014
 - Global Customer Base
 - Multiple CFD practitioners on staff
- We bridge CFD & IT for customers

Aerospace & Defense

Automotive & Transport

Consumer & Heavy Industry

Energy & Environmental

Serving the Global CFD Community

Software Products

- FieldView family, from laptops to HPC (licensed)
- VisIt scalable, advanced visualization (open source)
- Best-in-class global customer support

Custom Engineered Solutions

- Training (on-site, via the web or at Intelligent Light)
- Script development
- Customize FieldView & VisIt
- Workflow Automation & Optimization

Applied Research Group (ARG)

- R&D in advanced post-processing & CFD methods
- Teamed with global experts
- Feeds technology into FieldView and VisIt

Helping our customers to do more with less and make better decisions

Libsim puts VisIt in situ

- Libsim lets VisIt connect to simulations and access their data
- Scales to 100K processors and beyond
- Avoids I/O and data movement
- Supports automated data product generation

VisIt

- Versatile open source software for visualizing and analyzing petascale simulation datasets

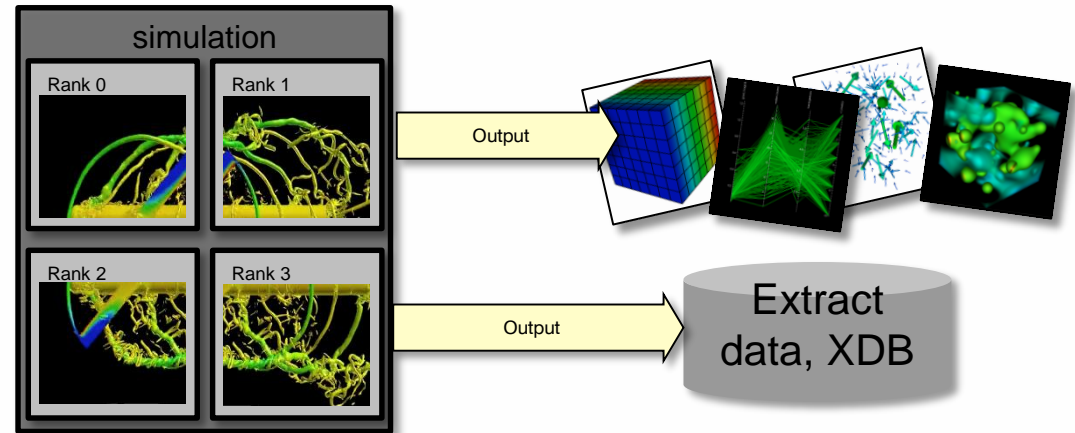

Libsim

- Enables simulations to perform data analysis and visualization in situ by applying VisIt algorithms to data.

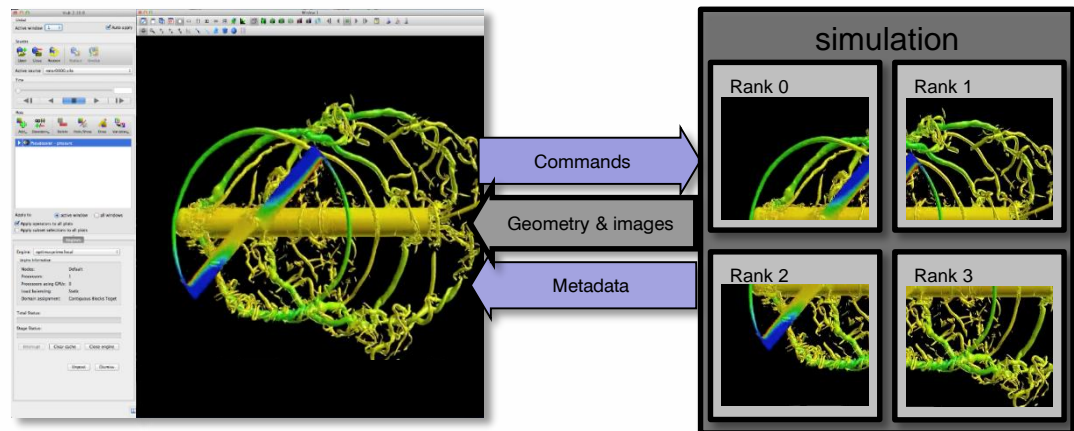

Libsim Enables Flexible Workflows

- Create automated routines to generate data in batch
 - Render images using VisIt plots and operators
 - Extract data and export

- Interactively connect via the VisIt GUI
 - Explore!
 - All functions available
 - Use custom simulation user interfaces to monitor simulation

XDB Workflow

- Use Libsim to instrument simulation so it produces **FieldView XDB files** for later visualization in Fieldview
 - XDB is a CFD format made of surfaces and streamlines which provides geometry

XDB's overcome in situ's greatest perceived weakness

– *that you need to have some idea of what you want to see in the end*

- Permits interactive exploration using post-processing methods
- Cheap enough to save frequently

XDB Generation is Decoupled from Visualization

- XDB visualization can run on separate compute resources
- Fewer cores can be allocated
- Users can leverage their preferred visualization software

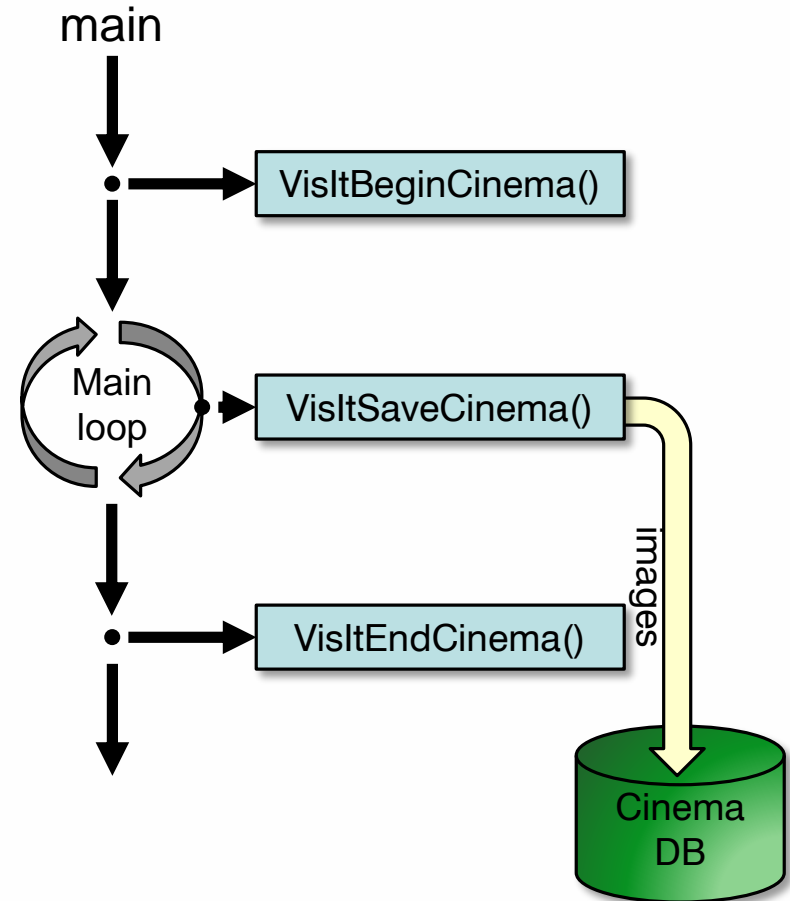

FieldView

- Sold for CFD post-processing since 1991
- Over 3000 licenses of FieldView in use today throughout the world
- Industries ranging from aerospace and automotive to nuclear engineering, turbomachinery, wind energy and food processing

Libsim and Cinema

- Libsim extended with functions to make Cinema databases
 - Large set of plot images from various camera angles that provides a proxy for interaction/exploration
 - Sets up directory structure, saves images of Vislt plots, creates index

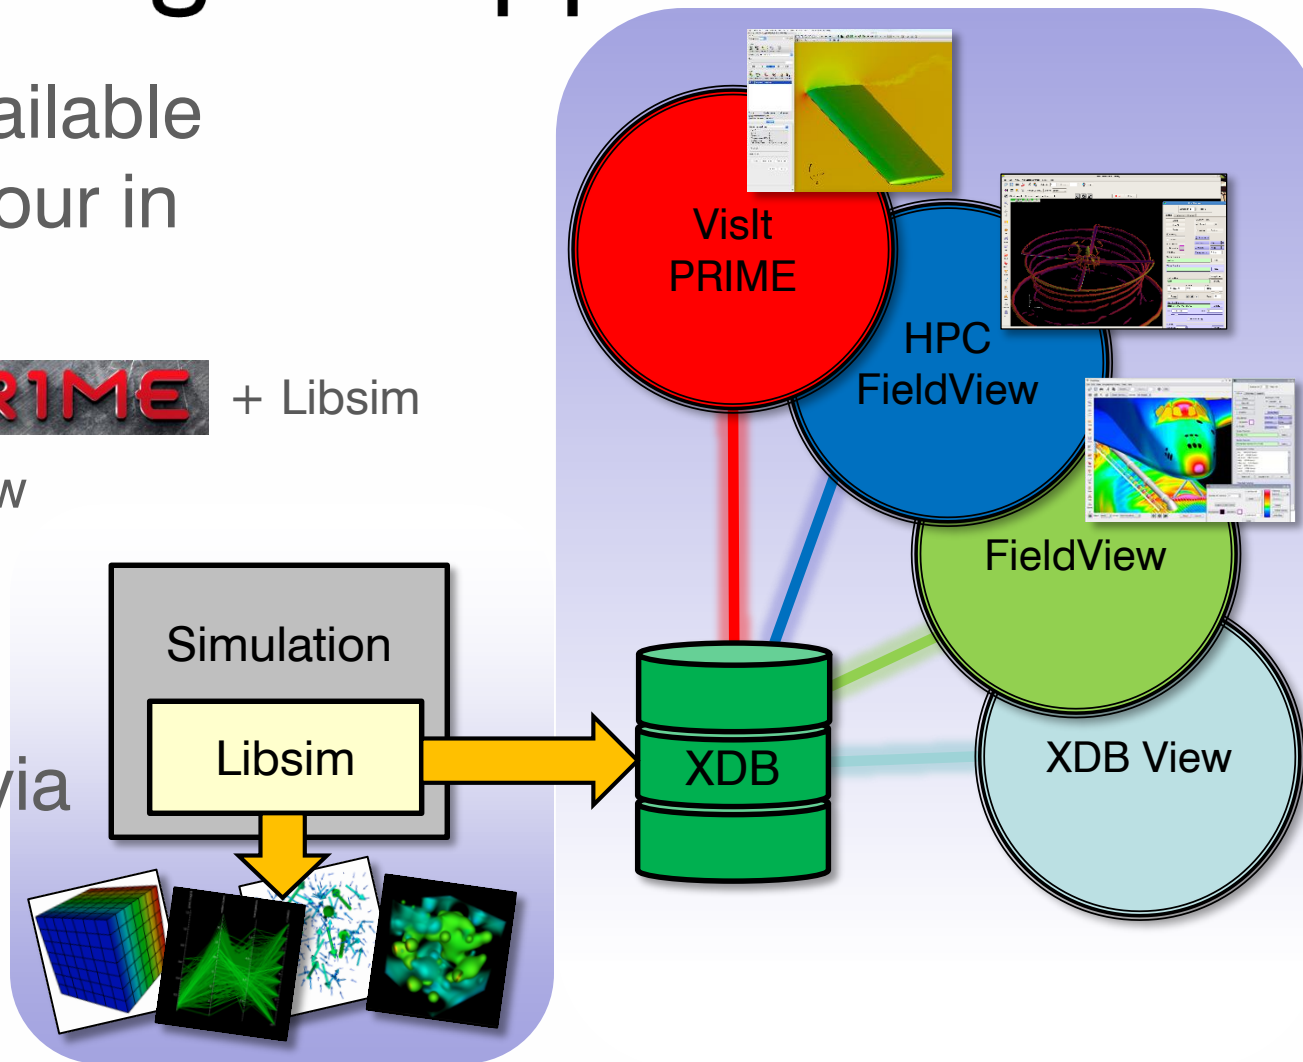

Intelligent Light Supports In Situ

- Products available to support your in situ efforts

- **VisitPRIME** + Libsim
- HPC FieldView
- FieldView
- XDB View

- Connected via XDB

Intelligent Light Wants to Support You

Software Products

• FieldView family, from

Custom Engineered Solutions

Applied Research Group (ARG)

- VisIt porting and installation
- Guidance for *do-it-yourself* solver instrumentation
- Complete solver instrumentation using Libsim
- Workflow analysis and streamlining
- Paid support and training

Libsim Enables Wind Farm Analysis

- Dr. Dmitry Mavriplis' group at University of Wyoming instrumented their code with Libsim

- Simulations on Cheyenne and Yellowstone computers (~30K cores)
- Higher order elements
- Silo/VTK output

- Intelligent Light advised and aided in porting

CREATE-AV Kestrel

- Fixed-wing air vehicle simulation suite
- Unstructured and AMR geometries
- Extract overhead **2-3% of solver runtime** to output isosurface and slice extracts to classic XDB format on 1024 cores
 - Writing volume data at same frequency would take 30% of runtime
- Extracts **21x smaller** (427Mb vs 9.1Gb)

B. Whitlock, J.R. Forsythe, S. M. Legensky "In Situ Infrastructure Enhancements for Data Extract Generation", AIAA SciTech, January 2016, San Diego, CA

Libsim enables in situ for many codes, including:

Nek5000

GADGET-2

DoD CREATE-AV/Kestrel

- Libsim/XDB integration via Kestrel's CFD GUI
- To be released in standard distribution

OVERFLOW2

- Libsim/XDB integration in use at NASA Johnson
- To be released in standard distribution

Intelligent Light looks forward to helping more solvers adopt Libsim and XDB!

- JAXA has plans to use Libsim and XDB
- Intelligent Light can advise commercial CFD codes on instrumenting with Libsim and XDB

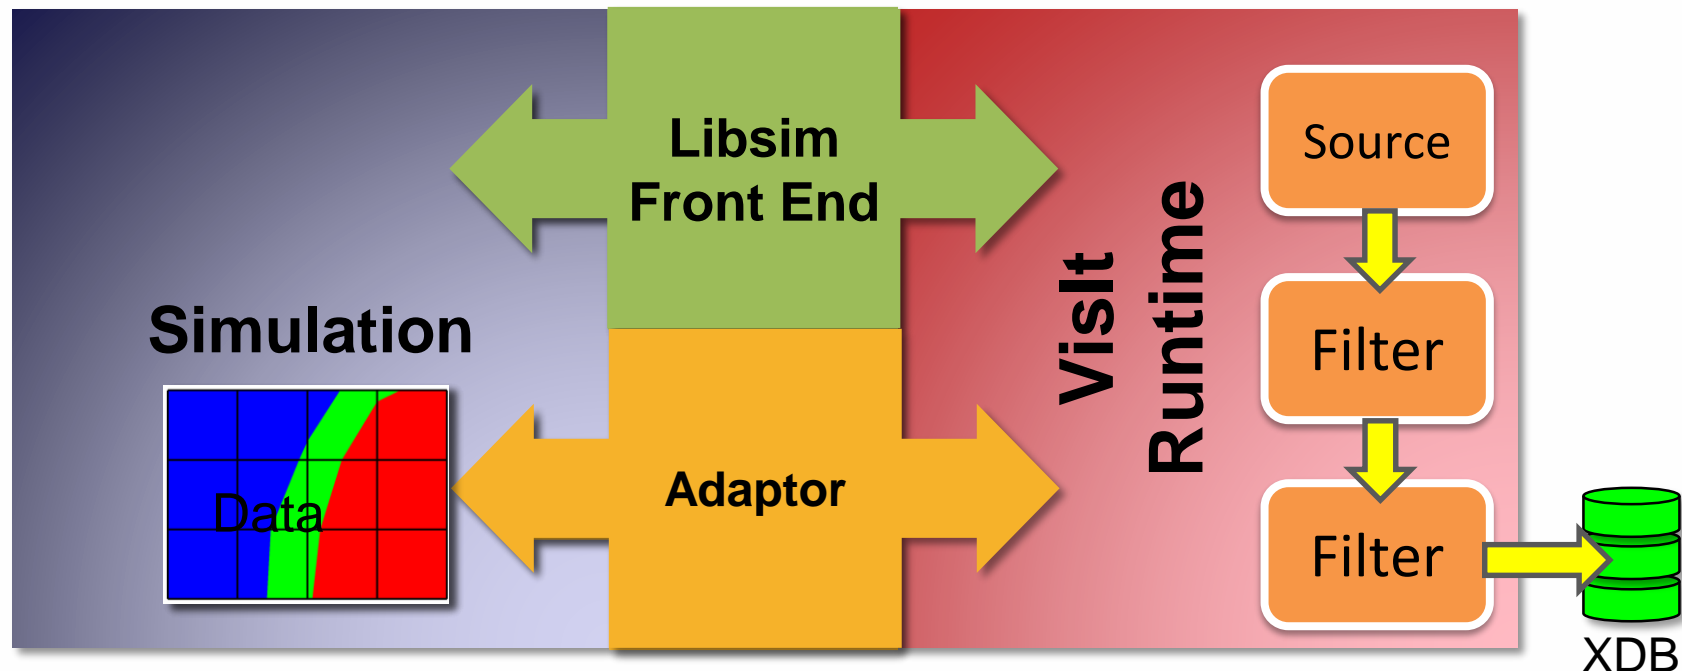

Instrumenting a Simulation

Libsim Connects Simulations and VisIt

- Expose simulation data structures to VisIt
 - Share arrays directly to avoid copies and data movement
- Enable VisIt to connect interactively to a simulation

VisIt/Libsim Data Model

- Mesh Types

- Structured meshes
 - Rectilinear/Curvilinear
 - I-Blanking
- Particle meshes
- Constructive Solid Geometry (CSG) meshes
- Adaptive Mesh Refinement (AMR) meshes
- Unstructured & Polyhedral meshes
 - Higher order

- Variables

- 1 to N components
- Zonal and Nodal
- Enumerated type

- Materials

- Species

Libsim Programming Interface

- Control Interface
 - Handles connections and processing commands
- Data Interface
 - Handles passing data back to Libsim
- Libsim bindings exist for C, C++, Fortran, Python
- Libsim allows for a lot of flexibility
 - Interactive vs Batch (or support both)
 - Blocking vs Polling
 - A lot of common patterns can be copied from examples with little modification

Linking with Libsim

- Dynamic Linking

- VisIt/Libsim runtime library dynamically loaded when features are used

- C/C++

- `LIBS=-lsimV2`

- Static Linking

- VisIt/Libsim runtime, plugins, and 3rd party dependencies linked into simulation

- C/C++

- `LIBS=-lsimV2_static_par\
$(VTK_LIBS)`

- Fortran

- Add `-lsimV2f` to LIBS

- Includes Fortran adaptor functions for Libsim

Instrumenting a Simulation

Instrumentation
can be performed
incrementally

Step 1: Initialization

Step 2: Iteration

Step 3: Adaptor

Step 4: User Interface

Create User Interface
Create adaptor
functions that
respond to
commands from user
interface
Send user interface
state to VisIt

Environment / Setup

Step 1

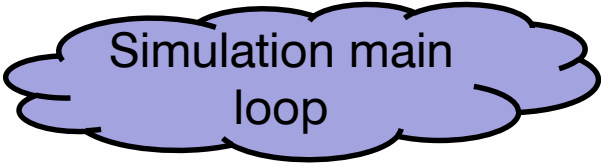

- Pass options to Libsim, such as path to VisIt
- Libsim needs to know about the environment to load the VisIt runtime library
- Initialize the runtime library
- Disconnect / shutdown when done with in situ

```
int main()
```

```
{
```

Initialize Libsim

Simulation main
loop

Finalize Libsim

```
return 0;
```

```
}
```

Set Rank, Parallel Flag, and Communicator (Parallel)

Step 1

- Libsim needs to know the rank and size of the process group
- An MPI communicator can be installed for Libsim that can be used to restrict operations to a subset of processors

```
/* Set parallel flag and rank*/
int par_rank = 0, par_size = 1;
MPI_Comm_rank (MPI_COMM_WORLD,
               &par_rank);
MPI_Comm_size (MPI_COMM_WORLD,
               &par_size);
VisItSetParallel(par_size > 1);
VisItSetParallelRank(par_rank);

/* Tell Libsim which MPI
communicator to use. */
MPI_Comm comm;
MPI_Comm_dup (MPI_COMM_WORLD,
              &comm);
VisItSetMPICommunicator(
    (void *) &comm);
```

Batch vs Interactive

Step 1

Libsim permits multiple ways of instrumenting the main loop

Batch

- VisIt 2.9.0 extends Libsim with a batch-only support
 - Forces load of VisIt runtime library
 - Does not listen for interactive connections (simpler to implement)
 - Does not need VisIt clients to set up plots for in situ

Interactive

- The simulation must call Libsim periodically to respond to VisIt connection requests or commands
 - Opens a listen socket
 - Writes “*sim2*” file that VisIt can use to initiate a connection
 - A successful connection causes the VisIt runtime library to be loaded

Batch Initialization

Step 1

- Batch Initialization requires the VisIt runtime library to be loaded explicitly
- Once the runtime is loaded, register data adaptor functions
- Call functions to set up visualization

```
VisItInitializeRuntime();
```

```
VisItSetGetMetaData(SimGetMetaData, NULL);
```

```
VisItSetGetMesh(SimGetMesh, NULL);
```

```
VisItRestoreSessionFile(  
    "/path/to/setup.session");
```

Interactive Initialization

Step 1

- Interactive initialization assumes that code for input processing will be added to the main loop
- VisIt connections are initiated by reading a *“.sim2”* file created by the simulation on rank 0

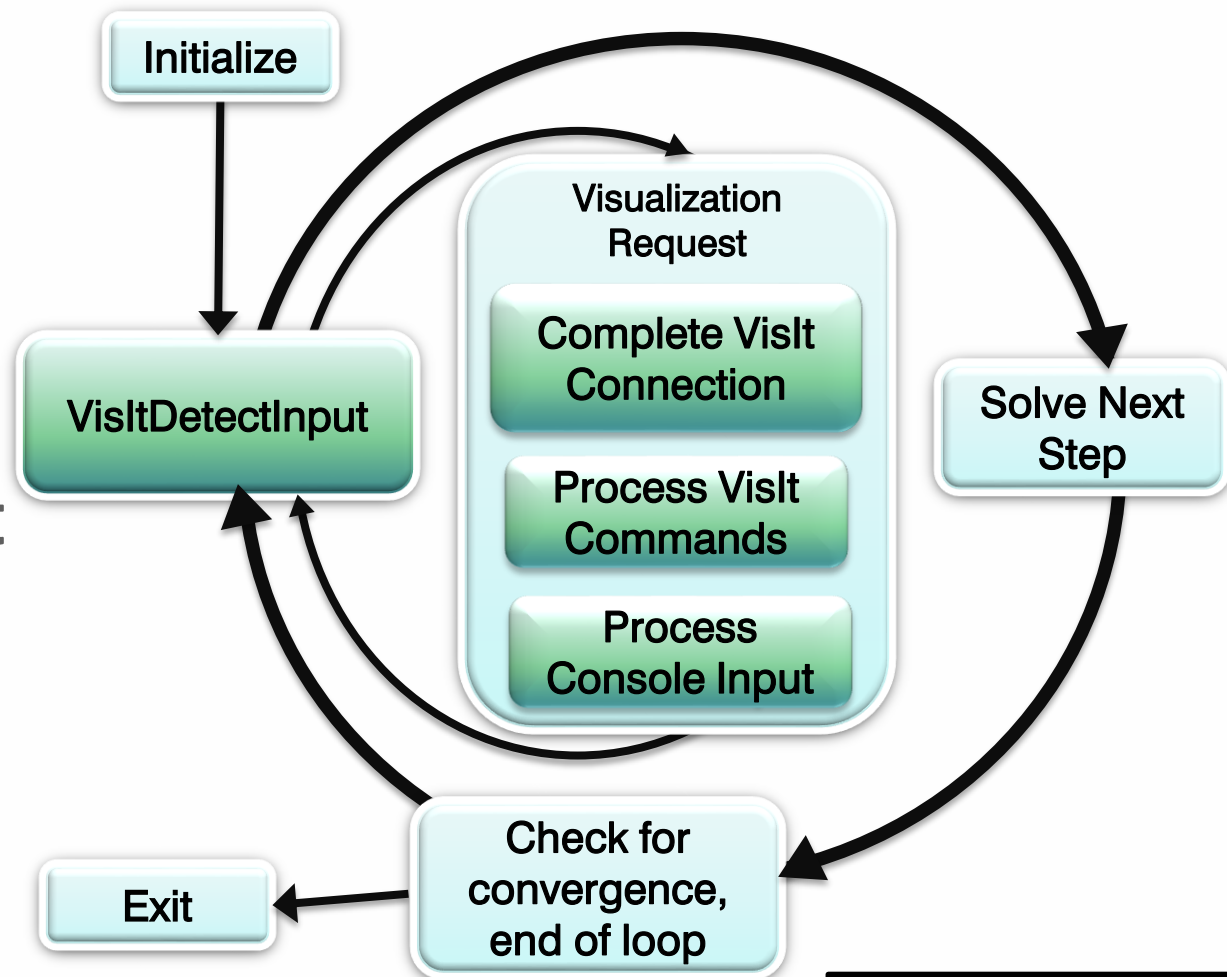

```
if (par_rank == 0)
{
    /* Write out .sim2 file that VisIt uses to connect. */
    VisItInitializeSocketAndDumpSimFile ("sim_name",
        "A useful description of the simulation",
        "/path/to/where/sim/was/started",
        NULL, /* reserved */
        NULL, /* reserved */
        NULL /* optional: pass filename for sim2 file */
    );
}
```

Skip for batch mode

Interactive Main Loop

Step 2

- Libsim opens a socket and writes out connection parameters
- Call **VisitDetectInput** to check for:
 - Connection request
 - Visit commands
 - Console input

Skip for batch mode

Interactive Main Loop

Step 2

- Libsim opens a socket and writes out connection parameters
- Call **VisitDetectInput** to check for:
 - Connection request
 - Visit commands
 - Console input

```

int main()
{
    struct Simulation sim;
    while(! done) {
        Computations
        insitu(&sim);
    }
}

void insitu(Simulation *sim) {
    int err = 0, visitstate, blocking;

    /* Get input from VisIt or timeout. */
    if(sim->par_rank == 0) {
        blocking = (sim->runMode == SIM_STOPPED) ? 1 : 0;
        visitstate = VisitDetectInput(blocking, fileno(stdin));
    }
    /* Broadcast VisItDetectInput return value. */
    MPI_Bcast(&visitstate, 1, MPI_INT, 0, MPI_COMM_WORLD);
    switch(visitstate) {
    case 1: /* Complete VisIt Connection*/
        CompleteVisItConnection(sim);
        break;
    case 2: /* Process VisIt Command. */
        ProcessVisItCommand(sim);
        break;
    case 3: /* Process Console Input */
        ProcessConsoleInput(sim);
        break;
    }
}

```

You supply these functions

Skip for batch mode

Interactive Main Loop

Step 2

• Ithsim opens a

```

/* Connect to VisIt, load runtime */
if(VisItAttemptToCompleteConnection()
    == VISIT_OKAY)
{
    VisItSetCommandCallback(
        ControlCommandCallback,
        (void*)sim);
    VisItSetSlaveProcessCallback2(
        SlaveProcessCallback,
        (void*)sim);

    /* Install adaptor callbacks */
    VisItSetGetMetaData(
        SimGetMetaData, (void*)sim);

    VisItSetGetMesh(
        SimGetMesh, (void*)sim);

    VisItSetGetVariable(
        SimGetVariable, (void*)sim);
}

```

- VISIT commands
- Console input

```

int main()
{
    struct Simulation sim;

    /* Process a command from VisIt */
    VisItProcessEngineCommand();

    /* Optional. Handle console */
    char cmd[1000];
    if (sim->par_rank == 0)
    {
        if(VisItReadConsole(1000, cmd)
            == VISIT_ERROR)
        {
            strcpy(cmd, "quit");
        }

        /* Broadcast the command */
        MPI_Bcast(cmd, 1000, MPI_CHAR, 0,
            MPI_COMM_WORLD);

        /* Broadcast VisItDetectInput */
        MPI_Bcast(&visitstate, 1, MPI_CHAR, 0,
            MPI_COMM_WORLD);

        /* Process the command */
        if(strcmp(cmd, "quit") == 0)
        switch(visitstate) {
            case 1: /* Complete VisIt Connection */
                CompleteVisItConnection(sim);
                break;
            case 2: /* Process VisIt Command. */
                ProcessVisItCommand(sim);
                break;
            case 3: /* Process Console Input */
                ProcessConsoleInput(sim);
                break;
        }
    }
}

```

↓

```

void insitu(Simulation *sim) {
    int err = 0, visitstate, bloc

    /* Get input from VisIt or ti
    if(sim->par_rank == 0) {
        blocking = (sim->runMode
        visitstate = VisItDetectI
        MPI_COMM_WORLD);
    }

    /* Broadcast VisItDetectInput
    MPI_Bcast(&visitstate, 1, MPI
    if(strcmp(cmd, "quit") == 0)
    switch(visitstate) {
        sim->done = 1;
    case 1: /* Complete VisIt Connection */
        CompleteVisItConnection(sim);
        break;
    case 2: /* Process VisIt Command. */
        ProcessVisItCommand(sim);
        break;
    case 3: /* Process Console Input */
        ProcessConsoleInput(sim);
        break;
    }
}

```

You supply these functions

Skip for batch mode

Operations During an Iteration

Step 2

- Tell VisIt that the time step changed so new metadata will be obtained
- Create or update plots with new simulation data
- Save plots to an image or export them

Tell VisIt there are new data

```
// Set up plots using a session file  
VisItRestoreSession(filename);
```

Save an image

Save an XDB

Setting up Plots

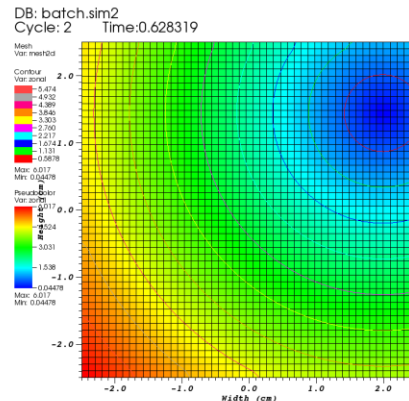

Contributed as
open source

Step 2

- Libsim provides 2 ways to set up plots in situ:
 - Set up plots programmatically
 - Set up plots using VisIt session files

```
/* Set up some plots using libsim functions. */
```

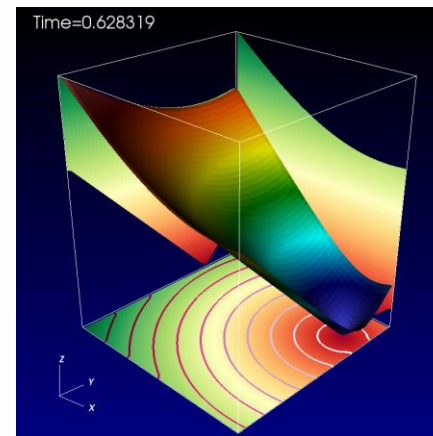

```
VisItAddPlot("Mesh", "mesh2d");
VisItAddPlot("Contour", "zonal");
VisItAddPlot("Pseudocolor", "zonal");
VisItDrawPlots();
```

libsim file
Thu Nov 12 11:17:29 2015

```
/* Set up some plots using a session file */
```

```
VisItRestoreSession("A.session");
```

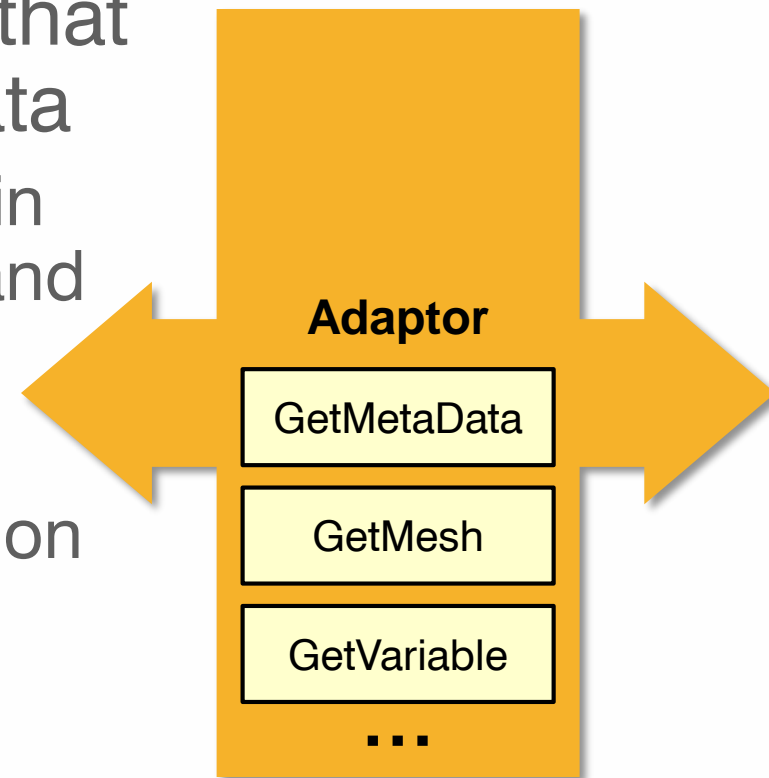

- Dynamically create plots and set their attributes

- More customization is possible

Adaptor

Step 3

- An adaptor comprises a set of functions in the simulation that VisIt calls when it needs data
 - Packages simulation's data in terms that VisIt can understand
 - Return actual pointers to simulation data (*zero copy*)
 - Return alternate representation that VisIt can free
 - Written in C, C++, Fortran, Python

Adaptor Functions

Function	Description
GetMetaData	Creates a metadata object that tells Visit the entities advertised from the simulation
GetMesh	Returns a mesh object that contains the simulation's mesh coordinates and connectivity
GetVariable	Returns a data array object containing a simulation field
GetMaterial	Return a material object describing how the mesh can be decomposed into various materials
GetSpecies	Return a species object indicating how the mesh's materials are decomposed into various material species
GetDomainList	Return a list of domains owned by the current MPI rank

Additional adaptor functions return data for advanced features

Registering Adaptor Functions

Step 3

- Adaptor functions need to be registered with Libsim at runtime, once the VisIt runtime library has been loaded
 - Fortran adaptors rely on functions with specific names

```

visit_handle SimGetMetaData(void *cbdata)
{
    visit_handle md = VISIT_INVALID_HANDLE;
    if(VisIt_SimulationMetaData_alloc(&md)
        == VISIT_OKAY)
    {
        /* Add items here */
    }
    return md;
}

```

```

VisItSetGetMetaData(SimGetMetaData, (void*)sim);
VisItSetGetMesh(SimGetMesh, (void*)sim);
VisItSetGetCurve(SimGetVariable, (void*)sim);

```

Example GetMetaData Function

Step 3

- Return the inventory of data that will be exposed to Visit
 - Meshes
 - Scalars
 - Vectors
 - etc
- Used to populate menus, etc

```
visit_handle SimGetMetaData(void *cbdata)
{
    visit_handle md, mmd;

    Set global simulation information into metadata

    Add mesh metadata to the simulation metadata

    return md;
}
```

Set global simulation information into metadata

Add mesh metadata to the simulation metadata

Visit_VariableData

- Libsim describes data arrays using the Visit_VariableData object
- Visit_VariableData stores:
 - Pointer to the data
 - Number of Components
 - Number of Tuples
 - Owner of the data
- Libsim accepts contiguous data zero-copy
 - Visit_VariableData_setDataX()

Passing Data for Structure of Arrays

Obtain XYZ coordinate values zero-copy:

```
int N = 100;
float *x = new float[N];
float *y = new float[N];
float *z = new float[N];
```

```
visit_handle coords;
```

```
int stride = sizeof(float);
```

```
Visit_VariableData_alloc(&coords);
```

```
Visit_VariableData_setArrayDataF(coords, 0, VISIT_OWNER_SIM, N, 0,
stride, (void *)x);
```

```
Visit_VariableData_setArrayDataF(coords, 1, VISIT_OWNER_SIM, N, 0,
stride, (void *)y);
```

```
Visit_VariableData_setArrayDataF(coords, 2, VISIT_OWNER_SIM, N, 0,
stride, (void *)z);
```

Memory

Passing Data for Array of Structures

Obtain Y values zero-copy:

```
struct Particle {
    float x,y,z,mass;
};
int N = 100;
Particle *data = new Particle[N];
```

```
visit_handle yvalues;
int offset = sizeof(float);
int stride = sizeof(Particle);
Visit_VariableData_alloc(&yvalues);
Visit_VariableData_setArrayDataF(yvalues, 0, VISIT_OWNER_SIM,
N, offset, stride, (void *)data);
```

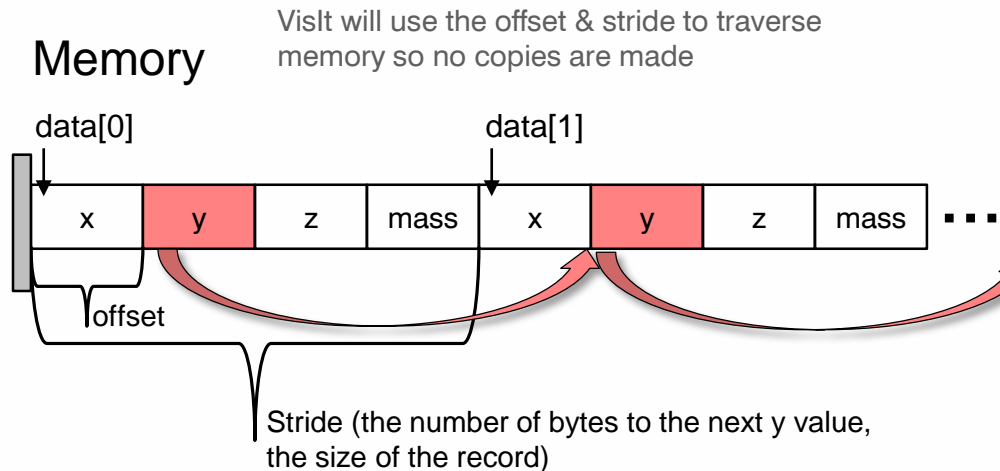

Number
of tuples

Offset: starting
address of y field
within Particle

Stride: number
of bytes in
between Y data
values

Data: the start
of the particle
data

First component

Passing Data for Array of Structures

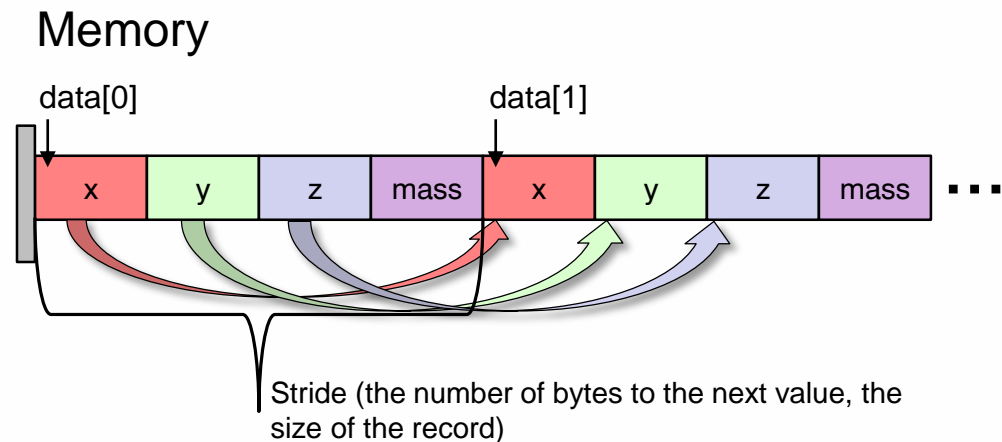

Obtain XYZ coordinate values zero-copy:

```

struct Particle {
    float x,y,z,mass;
};
int N = 100;
Particle *data = new Particle[N];

visit_handle coords;
int offset = sizeof(float);
int stride = sizeof(Particle);
VisIt_VariableData_alloc(&coords);
VisIt_VariableData_setArrayDataF(coords, 0, VISIT_OWNER_SIM, N, 0,
stride, (void *)&data[0].x);
VisIt_VariableData_setArrayDataF(coords, 1, VISIT_OWNER_SIM, N, 0,
stride, (void *)&data[0].y);
VisIt_VariableData_setArrayDataF(coords, 2, VISIT_OWNER_SIM, N, 0,
stride, (void *)&data[0].z);

```

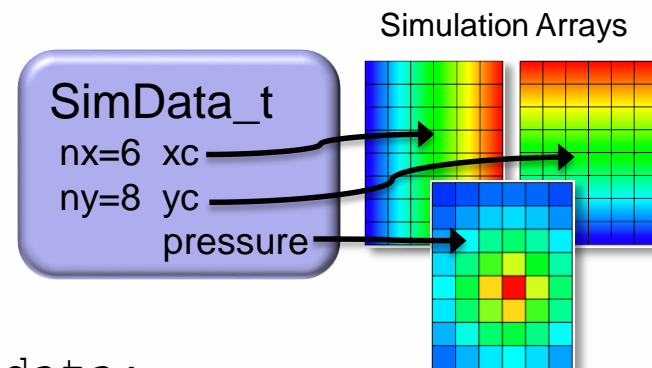

Example GetVariable Function

Step 3

Example

```
visit_handle
GetVariable(int domain, char *name,
           void *cbdata)
{
    visit_handle h;
    SimData_t *sim = (SimData_t *)cbdata;
```

Allocate VariableData
 object, save information
 about simulation array

```
return h;
```

```
}
```

Indicates owner of the
 Indicates number of array
 The array being shared

GetMesh Function

- This function is called when VisIt needs the simulation's mesh
- Returns a Libsim mesh object for the specified mesh+domain
- The mesh can be:
 - Rectilinear
 - Structured
 - Unstructured
 - AMR
 - CSG

Example GetMesh Function

Step 3

```
visit_handle
SimGetMesh(int domain, const char *name,
           void *cbdata) {
  SimData_t *sim = (SimData_t*)cbdata;
  visit_handle h, hxc, hyc;
  int dims[2]; dims[0] = sim->nx; dims[1] = dim->ny;
```

Allocate mesh object
Allocate VariableData object for coordinates

Store coordinate array information in VariableData

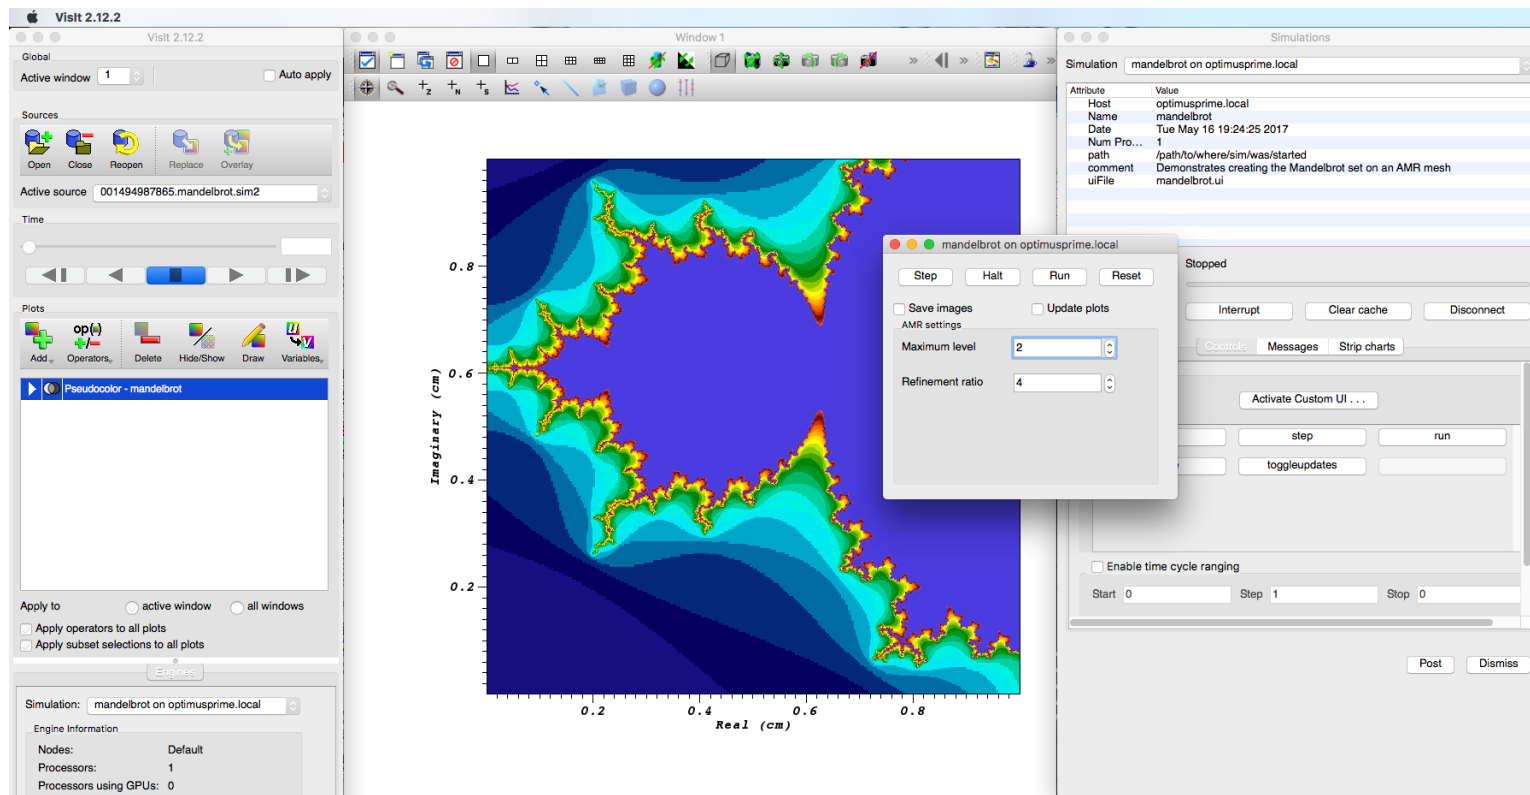

Associate coordinates with mesh

```
return h;
}
```

Simulation User Interface

Step 4

- VisIt's GUI can create dynamic user interface for simulation

Create User Interface in Qt Designer

Step 4

The screenshot displays the Qt Designer environment with the following components:

- Widget Box:** A sidebar on the left containing various widget categories such as Layouts, Spacers, Buttons, Item Views, Item Widgets, Containers, and Input Widgets.
- Signal/Slot Editor:** A central window for defining signal-slot connections.
- Action Editor:** A window for defining actions and their shortcuts.
- Object Inspector:** A panel on the right showing the widget hierarchy for the 'Mandelbrot' object, including 'gridLayout_2', 'horizontalLayout', and various widget classes like 'QPushButton' and 'QSpinBox'.
- Property Editor:** A panel at the bottom right showing the properties of the selected widget.
- Form - mandelbrot.ui:** A central window showing the visual design of the user interface. It features four buttons labeled 'Step', 'Halt', 'Run', and 'Reset'. Below the buttons are two sections: 'Save images' (disabled) and 'Update plots' (checked). Under 'Update plots', there are two spin boxes: 'Maximum level' set to 1 and 'Refinement ratio' set to 1.

Create UI Handler Functions

Step 4

- Register UI handler functions in simulation adaptor
 - Associate function with the name of the corresponding control in the UI (by name)
 - Handler function alters simulation state

```
void
ui_levels_changed(int value,
                  void *cbdata)
{
    simulation_data *sim =
        (simulation_data *)cbdata;
    sim->max_levels = value;
}
```

```
/* Register a ui action */
VisitUI_valueChanged("LEVELS",
                    ui_levels_changed, sim);
```

↑
Name of
control in UI
window

Summary

- In Situ is necessary to handle the large amounts of data produced by simulations
 - Using less storage
 - Using less time
- Libsim is a scalable in situ infrastructure
 - Freely available
 - Get it today and generate XDBs in parallel
- In Situ extract creation provides added benefits
 - Accelerate post-processing by not operating on volume-based results
 - Leverage FieldView XDB format

Libsim Information

Information about instrumenting a simulation can be found at the following sources:
